results

Conclusions

Goals & challenges:

- introduce novel wave-energy device;
- provide **nonlinear model** for new wave-2-wire device;
- provide **linearised shallow-water model** of device;
- **discretise** in space, in time & in space-time;
- show **preliminary simulations**; and,
- **open questions**: validation, optimisation,

Motivation: rogue waves

Wave-to-wire
energy device

Introduction

Modelling

Linearise
wave-2-wire
model

Discretise
wave-2-wire
model

Preliminary
results

Conclusions

Rogue waves are anomalously high waves defined relative to a significant wave height H_s .

- Index (Kharif et al. '09, Dysthe et al. '08):

$$AI = H_{rw}/H_s > 2 \quad \text{or} \quad AI = \eta_{rw}/H_s > 1.25$$

- Relevance in maritime & coastal engineering
- Pyramidal rogue wave (Faulkner 2001):

Fig.1. Pyramidal wave off south Japan

Motivation: rogue waves

Wave-to-wire
energy device

Onno

Wout Zwaanswijk)

Introduction

Modelling

Linearise
wave-2-wire
model

Discretise
wave-2-wire
model

Preliminary
results

Conclusions

There are many causes of rogue waves, see Kharif et al. (2009):

- E.g., crossing seas, nearly standing/pyramidal waves
- We made a *bore-soliton splash* rogue wave:
$$AI = \frac{H_{rw}}{H_s} = \frac{3.5}{0.35} \approx 10$$
- It inspired our wave-2-wire wave-energy device.

Conclusions

Dynamics of water waves $\{\phi, h\}$, wave-activated buoy motion $\{Z, W\}$ & electro-magnetic generator $\{Q, P_Q\}$ with current I , $I = \dot{Q}$ and $P_Q = L_i I - K(Z)$ & LED-loads:

$$\nabla^2 \phi = 0$$

$$\partial_t h + \nabla_H \phi \cdot \nabla h - \partial_z \phi = 0 \text{ on } z = h$$

$$\partial_t \phi + \frac{1}{2} |\nabla \phi|^2 + g(h - H_0) + \underline{\lambda \Theta(y - y_b)} = 0 \quad \text{on } z = h$$

$$\underline{h - h_b} = 0 \quad \text{for } y \geq y_b(x, t)$$

$$\dot{Z} = W$$

$$M \dot{W} = -Mg - \gamma(P_Q + K(Z)) \frac{G(Z)}{L_i} + \rho_0 \int_0^{L_x} \int_0^{l_y(x)} \underline{\lambda \Theta(y - y_b)} \, dx \, dy$$

$$\dot{Q} = (P_Q + K(Z))/L_i \equiv I$$

$$\dot{P}_Q = -(R_c + R_i)I - \underline{\text{sign}(I)n_q V_T \ln(|I|/I_{sat} + 1)}.$$

Modelling

Linearise
wave-2-wire
model

Discretise
wave-2-wire
model

Preliminary
results

Conclusions

Variables & parameters **water waves**:

- potential flow $\mathbf{u} = \nabla\phi(x, y, z, t)$
- (single-valued) water depth $h = h(x, y, t)$, surface potential $\phi_s(x, y, t) = \phi(x, y, h(x, y, t), t)$

$$\nabla^2\phi = 0$$

$$\partial_t h + \nabla_H \phi \cdot \nabla h - \partial_z \phi = 0 \text{ on } z = h$$

$$\partial_t \phi + \frac{1}{2} |\nabla \phi|^2 + g(h - H_0) + \underline{\lambda \Theta(y - y_b)} = 0 \quad \text{on } z = h$$

$$\underline{h - h_b} = 0 \quad \text{for } y \geq y_b(x, t)$$

- acceleration of gravity g and vertical (free-surface) rest level H_0
- (single-valued) **waterline** $y = y_b(x, t)$.

Linearise
wave-2-wire
model

Discretise
wave-2-wire
model

Preliminary
results

Conclusions

- By solving the Maxwell's equations, the function

$$G(Z) = \frac{\pm 1}{\pi A_m^2 L_m a} \int_{-L/2}^{L/2} \int_0^{2\pi} \int_0^{A_m} F(z) dr d\theta dq$$

- arises with $F(z) = f(-z) - f(z)$, $z = q + \bar{Z} + \alpha_h H_m - Z$,

$$f(z) = r(a - r \cos \theta) / (r^2 + (\frac{L_m}{2} + z)^2 + a^2 - 2ra \cos \theta)^{3/2}.$$

wave-2-wire
model
Discretise
wave-2-wire
model
Preliminary
results
Conclusions

- When the change of current I in time & loads small, s.t.
 $\dot{I} \approx 0$:

$$(R_c + R_i + \underline{R_l})I \approx \gamma G(Z)\dot{Z},$$

- then the vertical momentum equation for buoy, mast and magnet becomes approximately

$$M\dot{W} = -Mg - \frac{\gamma^2 G^2(Z)}{L_i(R_c + R_i + \underline{R_l})} W + \rho_0 \int_0^{L_x} \int_0^{l_y(x)} \lambda \Theta(y - y_b) dx dy.$$

- Resistance and loads combined act as drag* on the buoy-mast-magnet unit in this partial linear limit.

Introduction

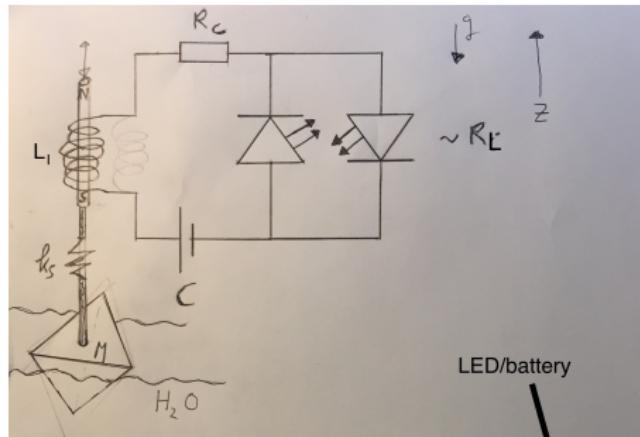

Modelling

Linearise
wave-2-wire
model

Discretise
wave-2-wire
model

Preliminary
results

Conclusions

- Free surface: $z = h(x, y, t)$ for $y < y_b(x, t)$
- Constrained surface: $z = h(x, y, t)$ for $y \geq y_b(x, t)$
- **Waterline motion** $y = y_b(x, t)$; evaluate Bernoulli in interior at surface, compare with free-surface Bernoulli:

$$p(x, y, h(x, y, t), t) = 0 \quad y < y_b(x, t)$$

$$p(x, y, h(x, y, t), t) = \lambda(x, y, t) \quad y \geq y_b(x, t),$$

- so $\lambda(x, y_b(x, t), t) = 0$ at $y = y_b$ is derived
- when $D = 1$ imposed strongly, like in Luke (1967 –WW only), then need to impose $\lambda(x, y_b, t) = 0$ a priori.

Conclusions

Consistency on discrete level (but only with **trick**):

The key consistency check is to ensure that the first seven equations in (28) are consistent with the last seven equations in (28). Consider the first seven equations. Take the time derivative of the primary constraint and eliminate the time derivatives by using two of the other seven equations, to obtain the secondary constraint

$$N_{kl}^T \left(M_{lk}^{-1} (S_{km}\phi_m + T_k \dot{R}) - 1_l \tilde{W} \right) = 0. \quad (30)$$

Now take the time derivative of this secondary constraint above and again eliminate the time derivatives by using two different equations of these seven equations, to obtain the consistency equation

$$\begin{aligned} & \left(N_{kl}^T M_{lk}^{-1} S_{km} M_{mn}^{-1} N_{nl} + C N_{kl}^T 1_l \tilde{Q}_l \right) \lambda_{\bar{l}} = -g N_{kl}^T M_{lk}^{-1} S_{km} \eta_m \\ & - \left(N_{kl}^T M_{lk}^{-1} S_{km} M_{mn}^{-1} N_{n\bar{b}} + C N_{kl}^T 1_l \tilde{Q}_{\bar{b}} \right) \lambda_{\bar{b}} \\ & + N_{kl}^T M_{lk}^{-1} T_k \ddot{R} + C_1 N_{kl}^T 1_l G(\bar{Z}) \left(\tilde{P}_Q + \gamma G(\bar{Z}) \tilde{Z} \right). \end{aligned} \quad (31a)$$

This consistency equation matches the last equation (28h) if and only if the following relations hold

$$\tilde{S}_{\bar{k}\bar{l}} = N_{kl}^T M_{lk}^{-1} S_{km} M_{mn}^{-1} N_{n\bar{l}} \quad (31b)$$

$$\tilde{S}_{\bar{k}m} = N_{kl}^T M_{lk}^{-1} S_{km} \quad (31c)$$

$$\tilde{S}_{\bar{k}\bar{b}} = N_{kl}^T M_{lk}^{-1} S_{km} M_{mn}^{-1} N_{n\bar{b}} \quad (31d)$$

$$\tilde{Q}_{\bar{k}} = N_{kl}^T 1_l \quad (31e)$$

$$N_{kl}^T M_{lk}^{-1} T_k = 0. \quad (31f)$$
